

Getting Started with CANVAS

If this is the first time you're using CANVAS or just need a refresher, here's a tutorial on how to set up a printer and slice a project with CANVAS.

Written By: Mosaic Support

Canvas

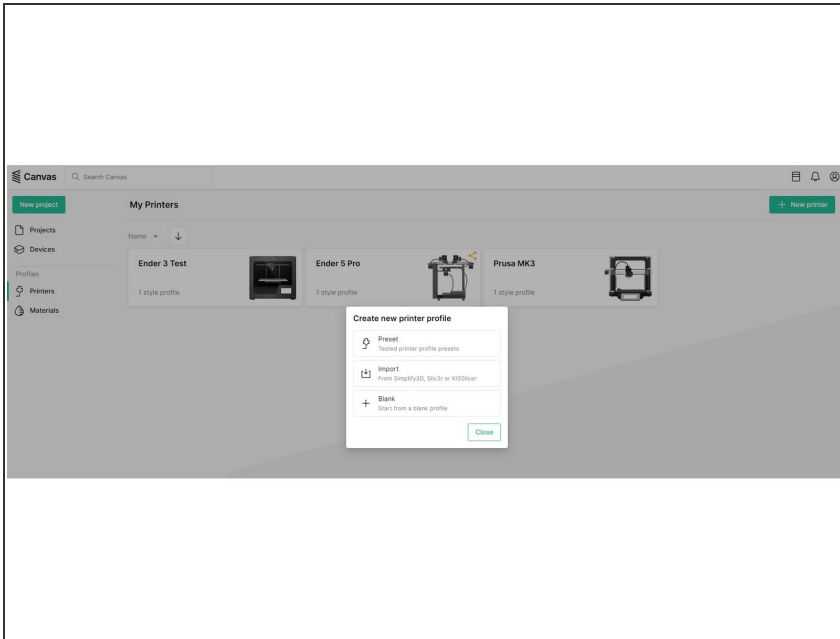

INTRODUCTION

[Canvas](#) is a cloud and web-based application designed for multi-material 3D printing.

Canvas allows you to color and slice single or multi-color models.

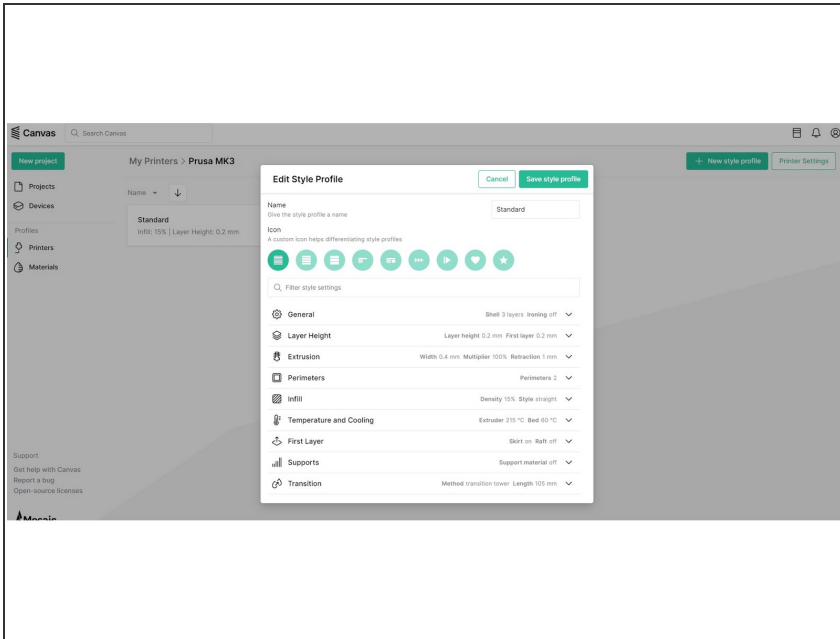

This guide provides an overview to get started, while providing an additional resource for each step.

Step 1 — Add or Create Printer Profile

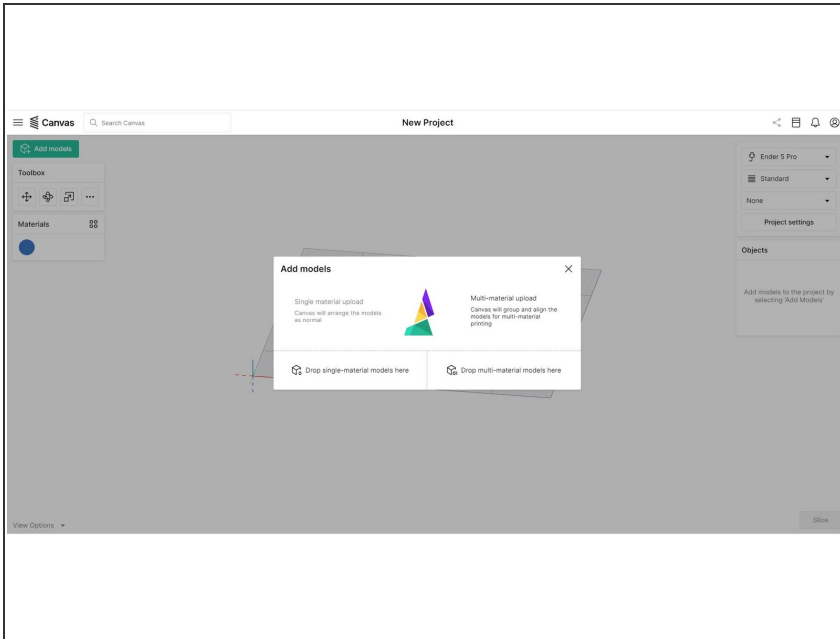

- Visit [Printers](#) and click on **New Printer**
- ⓘ Printer profiles can be 1) created as a new profile 2) imported from Simplify3D, Slic3r/Prusaslicer, or Kisslicer and 3) based off of a printer preset.
- Custom start and end sequences for bed leveling can be copied into the printer profile.
- Please see [here](#) for more information on how to create a new printer profile.
- After creating a new printer profile, there will be the option to create a setup for that profile. If this step is skipped, a new setup can still be manually created afterwards.

Step 2 — Add or Create a Style Profile

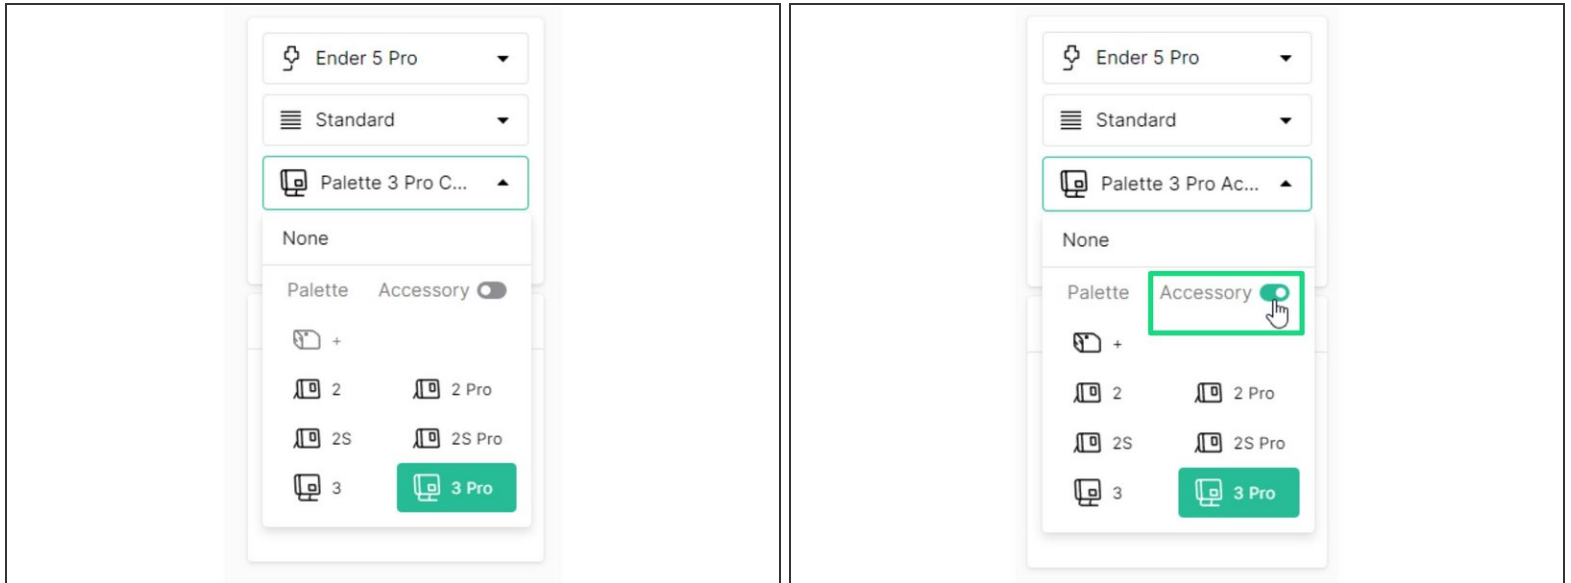

- **Style profiles are slicer settings.** Multiple profiles can be created for various printing results.
- Importing a printer profile from another slicer will create a new style profile based on existing settings.
- Creating a new style profile will automatically populate the settings. It would be recommended to run a single-color test print with these settings and further tuning the profile afterwards (e.g. extrusion widths, layer heights, speeds)
- [Printer tagging](#) allows for common settings to appear when hovering over tooltips for each project setting.
- Please see [here](#) for more information on creating a style profile and [the settings glossary](#).

Step 3 — Create a New Project and Upload Models

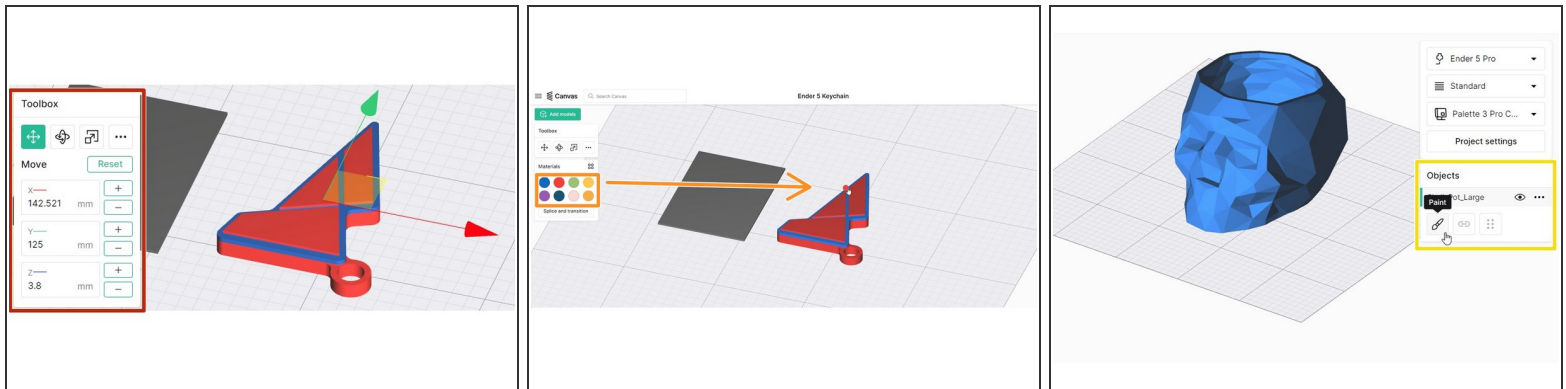

- Visit [Projects](#) and click **New Project**.
- ⓘ A project is where models can be customized for printing.
- Creating a new project will first prompt to upload models. If the model is one part, upload as a single-color print. If the model is multiple parts, upload it as a multi-material print.

Step 4 — Selecting Printer Profiles and Palette

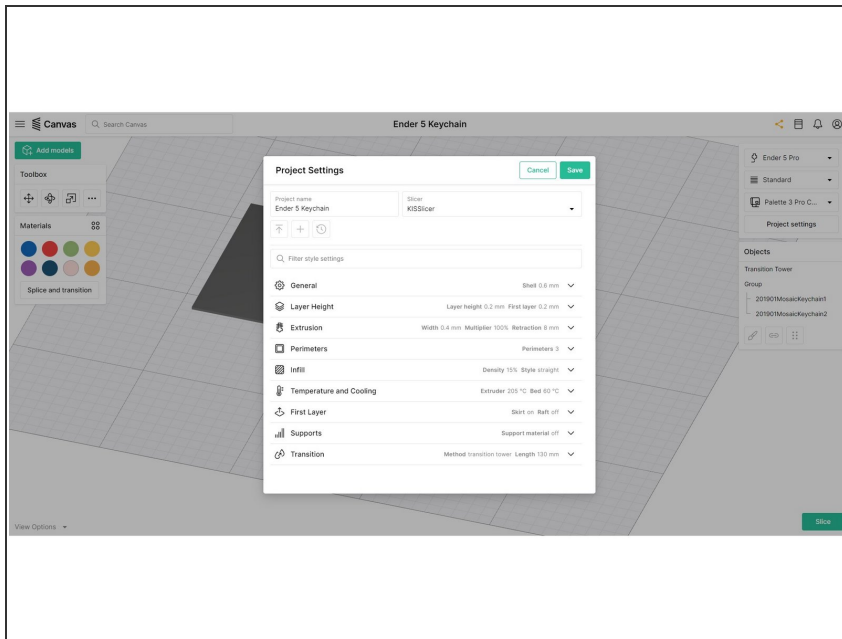

- On the top right of the project view, select the desired printer profile, style profile and Palette model.
- For Palette 2 and 3, connected mode will be selected by default.
- Use the toggle to enable accessory mode for Palette.
- For Canvas Hub, select Palette 2 in connected mode. With the [Canvas Hub](#) linked in Canvas, files can be transferred to it after slicing.

Step 5 — Place and Color Models

- **Toolbox:** Tools are available for translating/moving, rotation, and scaling.
 - More options in the toolbox include auto-arranging models, laying faces to the bed, dropping models to the bed, and custom supports.
- **Objects:** Grouping and Ungrouping Models - Select multiple models in the object browser by holding 'Shift + Left Click' on the models. Click the link button on the bottom of the object browser to group or ungroup the models selected.
- **Objects:** Duplicating a Model - Click the model you would like to duplicate, and then click the copy button on the bottom left of the object browser.
- If the model has multiple parts, color the model by dragging and dropping colors from the toolbox onto the model or the file name in the Objects
 - When working with multi-material projects, the transition tower will be auto-generated once colors are selected to each body.
- If only one STL is uploaded, the model can be customized with painting. To paint a model, select the STL in the object browser and then 'Paint.'

Step 6 — Project Settings

- Based on the style profile selected from the projects screen, expanded slicer settings are available.
- **For Palette printing - Transition Settings:** The transition length determines how much filament will be purged on the transition tower. Please see [variable transition settings](#) to learn more about this setting to help with bleed.
- Project settings can be:
 - Saved to the existing style profile, overriding the previous settings. This will enable any saved changes to be used next time the style profile is selected.
 - Saved as a new style profile, separate from the one first selected in the project.
 - Reverted to the original style profile if any erroneous changes were made to that project.

Step 7 — Slice and Print

- ❗ Slice your project. Preview layers and toolpaths by tool index, path type, layer height, print speed, fan speed and print temperature. For multi-material printing the preview will also display number of splices and pings.
- **Palette 3 Accessory Mode:** Download the files, and extract the folder. Transfer the MAFX file to the USB drive for Palette, and transfer the G-Code to the storage device for the printer (e.g. USB key, microSD, SD, WiFi)
- **Palette 3 Connected Mode:** If Palette 3 is linked in Canvas, MCFX file can be sent to it directly. Or, the MCFX file can be transferred to Palette's USB drive.
- **Palette 2 Accessory mode:** Download the files, and extract the folder. Transfer the MAF file to the SD card for Palette, and transfer the G-Code to the storage device for the printer (e.g. USB key, microSD, SD, WiFi)
- **Palette 2 Connected Mode:** If Canvas Hub is set up and Canvas account is linked and connected, send the print directly. The file can also be downloaded and uploaded to Octoprint manually.
